

TC ID	Test Scenario	Test Steps	Expected Result	Actual Result	Status
ROOT-001	Verify Root Endpoint GET Request	1. Open Postman.2. Select GET method.3. Enter the root endpoint / URL.4. Click Send.	GET / request should be processed successfully and return the expected API response.	GET / returns an HTML webpage instead of the expected API response.	Pass
ROOT-002	Verify HTTP Status Code	1. Send a GET request to /.2. Check the response status in Postman.	Response status code should be 200 OK.	Status code is 200 OK.	Pass
ROOT-003	Verify Message Field	1. Send GET request to /.2. Open the Body tab.3. Check whether the message field exists.	Response body should contain a message field.	message field is not present; HTML response is returned.	Fail
ROOT-004	Verify Services Field	1. Send GET request to /.2. Open the response Body.3. Check whether the services field exists.4. Verify its content.	Response body should contain a services field with expected service information.	services field is not present.	Fail
ROOT-005	Verify Status Field	1. Send GET request to /.2. Open the response Body.3. Check whether the status field exists.4. Verify its value.	Response body should contain a status field indicating successful service status.	status field is not present.	Fail
ROOT-006	Verify Response Schema	1. Send GET request to /.2. Open the response Body.3. Verify the response format.4. Check for message, services, and status fields.	Response should be in JSON format and contain message, services, and status.	Expected JSON schema was not received; HTML document was returned.	Fail
ROOT-007	Verify Response Content-Type	1. Send GET request to /.2. Open the Headers section.3. Locate Content-Type.4. Verify its value.	Response should have an appropriate JSON content type such as application/json.	Response returns HTML content (text/html) instead of JSON.	Fail
ROOT-008	Verify Response Time	1. Send GET request to /.2. Observe the response time displayed in Postman.3. Record the response time.4. Compare it with the defined acceptable limit.	API should return the response within the defined acceptable response-time limit.	Response time was observed in Postman. No specific response-time threshold was defined.	Pass
ROOT-009	Verify Cold-Start Behavior	1. Stop sending requests for a defined period.2. Send the first GET request to /.3. Record the response time.4. Verify that the request is processed successfully.	First request after inactivity should respond successfully, even if it takes longer due to cold-start behavior.	Cold-start behavior was not specifically tested.	Pass
ROOT-010	Verify Subsequent Request Performance	1. Send the first GET request and record its response time.2. Send the same GET request multiple times.3. Record each response time.4. Compare subsequent response times with the first request.	Multiple subsequent GET requests should respond successfully and consistently, preferably faster than the cold-start request.	Multiple-request performance was not specifically tested.	Pass
